

The TYPHOON Study

TONSILLECTOMY POSTOPERATIVE HAEMORRHAGE OUTCOMES AND OBSERVATIONS NATIONAL COHORT STUDY

The post tonsillectomy bleed rate has risen dramatically to 15.6% (2022-2023) from 4.9% (2003-2004). The reasons for this are unclear and need to be urgently addressed.

ENT INTEGRATE with the support of ENT UK will be launching a national prospective cohort study investigating the risk factors for post tonsillectomy bleeds on the 1st August 2025

Check out our website at www.entintegrate.co.uk (or scan the QR code) for further details on how to get involved!
