

# The TYPHOON Study

## TONSILLECTOMY POSTOPERATIVE HAEMORRHAGE OUTCOMES AND OBSERVATIONS NATIONAL COHORT STUDY

The post tonsillectomy bleed rate has risen dramatically to 15.6% (2022-2023) from 4.9% (2003-2004). The reasons for this are unclear and need to be urgently addressed.

ENT INTEGRATE with the support of ENT UK will be launching a national prospective cohort study investigating the risk factors for post tonsillectomy bleeds on the 1st August 2025

Check out our website at [www.entintegrate.co.uk](http://www.entintegrate.co.uk) (or scan the QR code) for further details on how to get involved!
